Stem Cells for Myocardial Regeneration: Methods and Protocols (Methods in Molecular Biology)

The field of regenerative medicine is in its infancy state. Enthusiasm for the potential of organ regeneration lies with the potential pluripotency of stem cells to differentiate into various tissue types. This volume of *Methods in Molecular Biology* will focus on the use of stem cells for myocardial repair and regeneration. The emphasis of this issue will be to provide basic scientists, translational investigators, and cardiologists a means to evaluate the efficacy and safety of stem cells in a standardized fashion for myocardial regeneration. Many different cell types have been considered for myocardial repair. Adult cardiomyocytes are unable to survive even when transplanted into normal myocardium. The use of fetal or neonatal cardiomyocytes is not a feasible source of cells due to ethical concerns and donor availability. Therefore, the use of pluripotent stem cells has become the focus of a cell source for myocardial repair and regeneration. A variety of stem cell types have been suggested to participate in myocardial repair. This has led the investigators to search for the “optimal cell type for myocardial repair”. Reliable isolation of the cell source with the ability to expand the cell population is a prerequisite. In the first section of this book, methods for isolation of commonly used stem cells being investigated for myocardial regeneration are presented. Once a stem cell source has been selected, the stem cell needs to be tested in an appropriate animal model before being translated into clinical practice.
